What's New in the IDEA PDF Viewer Plugin?

- PDF and PDF/A-1b are the standard document formats for Adobe's PostScript language (and the principal competitor to the TeX typesetting language). These files are binary, and thus cannot be viewed directly on the PC. The text/formats/image in the files must be converted to text/forms/images so that they can be interpreted by the PC. The standard text/formats/image viewers, which are sometimes used with LaTeX, cannot be used on PDF files (and are useless for viewing files, since they require the application which created the file to be launched in order to see any text or images). A proprietary plugin for IntelliJ IDEA lets you convert the binary to text/formats/image in order to use those viewers.
